

CamerAlert Set Up (iPhone)

1. First step is to download the app 'CamerAlert' from the AppStore - you can use the QR code below:

2. Once installed, launch the app and grant it permission to access your location and to show notifications.
3. Press the settings cog button at the bottom right of the screen.
4. Tap on 'Manage cameras' at the top of the settings menu.
5. Tap on 'Restore account'
6. Enter your username and password in the field provided to link your subscription to your device.
7. If not already on the Manage cameras screen, tap the settings cog (bottom right) then 'Manage cameras'. Tap on 'Download Database' to update to the latest set of cameras.
8. You are now ready to drive!
9. When you are outside with a good GPS signal tap on the crosshairs/target icon (bottom left) and it will turn on location tracking. Note if you are indoors it may show your location incorrectly - just wait until it picks up a better signal!
10. If the icon at the top right is blue then you have a good signal, if it is red then your GPS signal is poor and the app is unable to show your location.

Changing Settings

The default settings are fine for most people but you may want to adjust these to your liking.

Tap on the settings cog at the bottom right to go to 'Settings' and then tap the arrow to the right of 'Warnings'.

Recommended Settings:

Default range: 30 (default is 40)

Additional range for mobiles: 35-40 (default is 40)

Overspeed warning: Female voice (default is None)

To get to the advanced settings tap the ⓘ next to the 'Default range' option:

Advanced settings > Direction difference: 40 (default is 45)

Advanced settings > Warning cone: 40 (default is 45)

Advanced settings > Warning sensitivity: 45 (default is 50)

You may also want to play a sound before the main alert is given eg DING! fixed speed camera, 30 miles per hour. Go to settings and adjust the Pre-warning.

TIPS!

Make sure you start the app whenever you go out driving then it will run in background to alert even if using google maps etc

If you spot a new camera or mobile van location etc then tap the camera button at bottom right and add the details. Tip: tap it when you see the camera and that will log the location - then when it's safe to pull over etc fill out the rest of the details. The first user to submit a camera that is then confirmed gets a free 1yr subscription.

If a camera needs editing (eg changed speed, or been removed) then tap the camera on the map or tap the red alert bar and then edit/remove from there.

The database is updated every Wednesday evening and the app will give you an audible warning to say you are not using the latest database. Tap the settings cog and then 'Manage cameras' - you can also update at any time.

If you've left an average speed cam zone and it doesn't automatically stop then you can tap the speed (top left) to stop/start average calculations.
